What you'll learn about

- Equations
- Solving Equations
- Linear Equations in One Variable
- Linear Inequalities in One Variable

... and why

These topics provide the foundation for algebraic techniques needed throughout this textbook.

Properties of Equality

Let $u, v, w,$ and z be real numbers, variables, or algebraic expressions.

- Reflexive** $u = u$
- Symmetric** If $u = v,$ then $v = u.$
- Transitive** If $u = v,$ and $v = w,$ then $u = w.$
- Addition** If $u = v$ and $w = z,$ then $u + w = v + z.$
- Multiplication** If $u = v$ and $w = z,$ then $uw = vz.$

Linear Equations in x

A **linear equation in x** is one that can be written in the form $ax + b = 0,$ where a and b are real numbers with $a \neq 0.$

A **solution of an equation in x** is a value of x for which the equation is true. To **solve an equation in x** means to find all values of x for which the equation is true, that is, to find all solutions of the equation.

Operations for Equivalent Equations

An equivalent equation is obtained if one or more of the following operations are performed.

Operation	Given Equation	Equivalent Equation
1. Combine like terms, reduce fractions, and remove grouping symbols	$2x + x = \frac{3}{9}$	$3x = \frac{1}{3}$

Operations for Equivalent Equations

An equivalent equation is obtained if one or more of the following operations are performed.

Operation	Given Equation	Equivalent Equation
2. Perform the same operation on both sides.		
(a) Add (-3)	$x + 3 = 7$	$x = 4$
(b) Subtract $(2x)$	$5x = 2x + 4$	$3x = 4$
(c) Multiply by a nonzero constant $(1/3)$	$3x = 12$	$x = 4$
(d) Divide by a constant nonzero term (3)	$3x = 12$	$x = 4$

Example Solving a Linear Equation Involving Fractions

Solve for y . $\frac{10y-4}{4} = \frac{y}{4} + 2$

Copyright © 2011 Pearson, Inc.

Slide P.3 - 7

Solution

Solve for y . $\frac{10y-4}{4} = \frac{y}{4} + 2$

$$\frac{10y-4}{4} = \frac{y}{4} + 2$$

$$4\left(\frac{10y-4}{4}\right) = \left(\frac{y}{4} + 2\right)4 \quad \text{Multiply by the LCD}$$

$$10y - 4 = y + 8 \quad \text{Distributive Property}$$

$$9y = 12 \quad \text{Simplify}$$

$$y = \frac{4}{3}$$

Slide P.3 - 8

Linear Inequality in x

A **linear inequality in x** is one that can be written in the form

$ax + b < 0$, $ax + b \leq 0$, $ax + b > 0$, or $ax + b \geq 0$, where a and b are real numbers with $a \neq 0$.

Slide P.3 - 9

Properties of Inequalities

Let u, v, w , and z be real numbers, variables, or algebraic expressions, and c a real number.

1. Transitive If $u < v$, and $v < w$, then $u < w$.

2. Addition If $u < v$ then $u + w < v + w$.

If $u < v$ and $w < z$ then $u + w < v + z$.

3. Multiplication If $u < v$ and $c > 0$, then $uc < vc$.

If $u < v$ and $c < 0$, then $uc > vc$.

The above properties are true if $<$ is replaced by \leq .

There are similar properties for $>$ and \geq .

Slide P.3 - 10

Example Solving a Double Inequality

Solve the inequality and graph its solution set.

$$\frac{5}{3} \geq \frac{2}{3} - \frac{1}{2}x > -\frac{4}{3}$$

Copyright © 2011 Pearson, Inc.

Slide P.3 - 11

Solution

Solve the inequality and graph its solution set.

$$\frac{5}{3} \geq \frac{2}{3} - \frac{1}{2}x > -\frac{4}{3}$$

$$10 \geq 4 - 3x > -8$$

$$6 \geq -3x > -12$$

$$-2 \leq x < 4$$

$$[-2, 4)$$

Slide P.3 - 12

Quick Review

Simplify the expression by combining like terms.

1. $2x + 4x - y - 2y - 3x$

2. $3(2x - 2) + 4(y - 1)$

Use the LCD to combine the fractions. Simplify the resulting fraction.

3. $\frac{3}{x} + \frac{4}{x}$

4. $\frac{x+2}{4} + \frac{x}{3}$

5. $2 + \frac{2}{y}$

Copyright © 2011 Pearson, Inc.

Slide P.3 - 13

Quick Review Solutions

Simplify the expression by combining like terms.

1. $2x + 4x - y - 2y - 3x$ $3x - 3y$

2. $3(2x - 2) + 4(y - 1)$ $6x + 4y - 10$

Use the LCD to combine the fractions. Simplify the resulting fraction.

3. $\frac{3}{x} + \frac{4}{x}$ $\frac{7}{x}$

4. $\frac{x+2}{4} + \frac{x}{3}$ $\frac{7x+6}{12}$

5. $2 + \frac{2}{y}$ $\frac{2y+2}{y}$
